

Flight Connect Travel Tech CRM

Product Requirements Document (PRD) – MVP

Project: Flight Connect Travel Tech CRM

Prepared By: Rinnovar

Version: 1.0

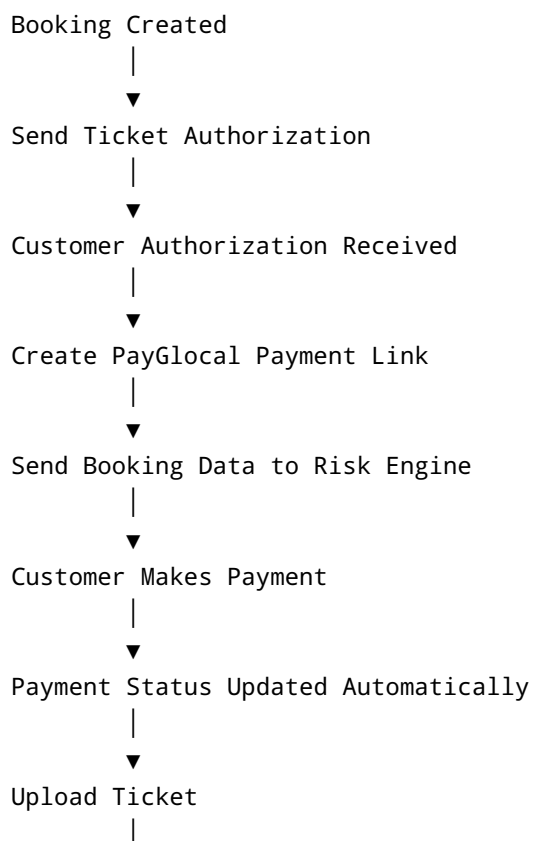

1. Objective

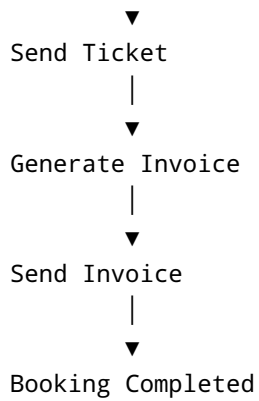

Develop a web-based CRM to manage the complete lifecycle of a **confirmed travel booking**.

Note: This CRM starts **after the customer has agreed to purchase**. Quotation management is **out of scope**.

The CRM should enable an agent to manage payment collection, ticket authorization, ticket issuance, invoicing, documents, and customer communication from a single booking screen.

2. Core Workflow

3. Booking Module

The booking module will already exist.

Supported booking types:

- Flight
- Hotel
- Car Rental
- Train
- Cruise

Each booking should have a unique Booking ID.

4. Ticket Authorization

Each booking should have a **Send Ticket Authorization** button.

Requirements:

- Send a predefined authorization email.
- Customer replies to authorize ticket issuance.
- Store the authorization email and customer reply against the booking.
- Update booking status accordingly.

5. Payment Gateway Integration (PayGlocal)

Each booking should have a **Create Payment Link** button.

The system should:

- Accept payment amount.
 - Generate payment link using PayGlocal API.
 - Store payment link against the booking.
-

6. Risk Engine Integration

While creating the payment link, the CRM should automatically send the required booking, customer, passenger, and travel information to PayGlocal's Risk Engine via API.

The implementation should be configurable so additional risk parameters can be added later without major code changes.

7. Payment Status

Once payment is completed, the CRM should automatically update:

- Payment Status
 - Transaction ID
 - Gateway Reference Number
 - Amount Paid
 - Currency
 - Payment Method
 - Payment Date & Time
-

8. Ticket Issuance

The agent should be able to:

- Upload ticket(s)
- Upload supporting travel documents
- Send ticket email with one click

The email should automatically attach the uploaded documents.

9. Invoice

The CRM should allow:

- Generate Invoice
- Download Invoice PDF

- Send Invoice via email

The invoice should remain attached to the booking.

10. Activity Timeline

Every booking should maintain a complete audit trail, including:

- Authorization Email Sent
- Authorization Received
- Payment Link Created
- Payment Received
- Ticket Uploaded
- Ticket Sent
- Invoice Generated
- Invoice Sent

All emails, documents, payment information, and activities should remain linked to the booking.

11. Email Automation

The CRM should support predefined email templates for:

- Ticket Authorization
- Ticket
- Invoice

All sent emails should be logged against the booking.

12. Document Management

Each booking should support uploading and storing:

- Tickets
 - Invoices
 - Hotel Vouchers
 - Car Rental Vouchers
 - Cruise Documents
 - Train Tickets
 - Passport Copies
 - Visa Documents
 - Any additional files
-

13. Technical Requirements

- Responsive web application.
 - Role-based authentication.
 - REST APIs.
 - Modular architecture.
 - Clean database design.
 - API-first approach.
 - Configurable integrations (avoid hardcoding).
 - Proper logging and error handling.
-

14. Deliverables

Phase 1 (MVP)

- Booking workflow
 - Ticket Authorization
 - PayGlocal Payment Link Integration
 - Risk Engine Integration
 - Payment Status Sync
 - Ticket Upload & Send
 - Invoice Generation & Email
 - Activity Timeline
 - Document Management
-

15. Success Criteria

An agent should be able to complete the following without leaving the booking screen:

1. Open confirmed booking.
2. Send Ticket Authorization.
3. Receive customer authorization.
4. Generate PayGlocal payment link.
5. Automatically send booking data to PayGlocal Risk Engine.
6. Receive payment status automatically.
7. Upload and send ticket(s).
8. Generate and send invoice.
9. View the complete history of emails, payments, documents, and activities for that booking.
